## Abstract

---

Single-cell RNA-sequencing is a powerful technology for identifying novel and known cell types, however its power is limited to organisms with well-annotated genomes. We demonstrate the utility of using annotation-agnostic methods which quantify cell-cell similarity using  $k$ -mer profiles. We benchmark a few methods and demonstrate the utility of converting cell types from mouse to human and back, and compare to using purely 1:1 mapped orthologous genes.

# Introduction

---

There are a predicted 8.7 million Eukaryotic species on earth [1], yet only 14% (1,233,500) have been catalogued and 0.001% (9,449) have genomes deposited in the National Center for Biotechnology Information Genome Assembly [2]. And yet, the genome sequence is not enough. To truly understand the diversity of life on this planet, we need to determine not just the DNA blueprints of life, but understand the instantiation of the DNA, the cell types of the species. While sequencing DNA gives a quantitative measure of the nucleotide differences, it does not inform the functional strategies that change with DNA sequence. As new species can be defined by a new cell type. For example, the existence of a single cell type, the Cnidocyte [3], a stinging cell of a single-celled biological weapon, defines the phylum Cnidaria. Thus, entire clades, not only species, can be defined by the introduction of an additional cell type or state.

Novel organizations of existing cell states can also define cell types. For example, the development of genitalia in amniotes, while using similar cell types, ultimately uses a different physical organization of cell types to generate genitalia in mammals compared to reptiles [4]

Determining common gene ancestry (“orthology”) is a difficult problem. Many approaches exist [5,6].

Determining common ancestry of cell types (“orthologous cell types”) [7,8] is an additional difficult problem. Comparative transcriptomics begins with finding a common feature set for embedding molecular profiles across divergent species into a common space. Many researchers take the approach of using one-to-one orthologous genes [Cite: brawand2011, CCA, LIGER, Scanorama, basically all the single cell “alignment” packages], others use clusters of orthologous groups [9], others map reads onto a common genome derived from whole-genome alignment [cite: recent primate brain paper from Barbara Treutlein], or map onto native genomes [10] and re-annotate using a tool such as Comparative Annotation Toolkit [11].

*k*-mers have been proposed for comparing single cells [12] as they are a fast, simple way to create cell-cell similarities. However, the work so far has focused on using annotated organisms and not cross-species analyses.

## Methods

---

Methods go here.

### Experimental

**Single-cell capture of primate brain organoids**

**Long read library prep**

**Short read library prep**

**Sequencing**

**Computational**

***k*-mer comparison of orthologous genes**

We used ENSEMBL version 97.

**Extraction of putative coding reads from RNA-seq**

**Results**

To determine whether short segments of sequences could detect gene orthologues, we  $k$ -merized orthologous genes derived from the ENSEMBL version 97 [13] COMPARA database [14] (Fig.~). We compared human protein sequences to orthologous chimpanzee, mouse, (orangutan, bonobo, gorilla, macaque, opossum, platypus, chicken) protein sequences, as these are species used in [15]. As a background, we randomly chose 10 non-orthologous genes relative to the human gene. In addition to  $k$ -merizing the protein-coding sequence, we also re-encoded the protein-coding sequence into Dayhoff [16] and hydrophobic-polar encodings [17], show in Table~.

**Table 1:** Dayhoff and hydrophobic-polar encodings are a reduced amino acid alphabet allowing for permissive cross-species sequence comparisons. For example, the amino acid sequence `SASHAFIERCE` would be Dayhoff-encoded to `bbbdbfecdac`, and HP-encoded to `phpphhpppp`.

Amino acid	Property	Dayhoff	Hydrophobic-polar (HP)
C	Sulfur polymerization	a	p
A, G, P, S, T	Small	b	A, G, P: h S,T: p
D, E, N, Q	Acid and amide	c	p
H, K, R	Basic	d	p
I, L, M, V	Hydrophobic	e	h
F, W, Y	Aromatic	f	h

**Figure 1:** Figure 1.

We found that, consistent with previous knowledge, that 1:1 orthologues had higher  $k$ -mer similarities as determined by the Jaccard Index.

Additionally, more recently diverged genes had higher  $k$ -mer similarity as well.

## Outlines

### Figure 1 outline

- Kmers can approximate orthologies
  - Jaccard similarity of orthologues is higher than non-orthologues
  - Benchmarking using <https://orthology.benchmarkservice.org/cgi-bin/gateway.pl>
  - Finding orthologues
    - Gold standard
      - ENSEMBL COMPARA
      - Quest for Orthologs consortium, Altenhoff, A. M., Boeckmann, B., Capella-Gutierrez, S., Dalquen, D. A., DeLuca, T., et al. (2016). Standardized benchmarking in the quest for orthologs. *Nature Methods*, 13(5), 425–430. <http://doi.org/10.1038/nmeth.3830> [5]
      - Orthologous groups/Conserved Domain Database [18]
- Kmers can find correct reading frame of RNA-seq reads
  - Human peptides → human RNAseq
  - Human peptides → chimp RNAseq
  - Human peptides → mouse RNAseq
- Kmers can find only transcription factor reads of TFs from RNA-seq reads
  - Human TFs → human RNAseq
  - Human TFs → chimp RNAseq
  - Human TFs → mouse RNAseq
- Overview of kmermaid pipeline
  - Comparison of tissue across species
    - Partition reads to coding/noncoding bins
    - MinHash the Dayhoff-encoded coding sequences
    - Jaccard similarity on the MinHashes

## Figure 2 outline

DOI: [10.1371/journal.pbio.2005594](https://doi.org/10.1371/journal.pbio.2005594) · PMID: [30142145](https://pubmed.ncbi.nlm.nih.gov/30142145/) · PMCID: [PMC6108454](https://pubmed.ncbi.nlm.nih.gov/PMC6108454/)

**29. Stem cell differentiation trajectories in Hydra resolved at single-cell resolution**

Stefan Siebert, Jeffrey A. Farrell, Jack F. Cazet, Yashodara Abeykoon, Abby S. Primack, Christine E. Schnitzler, Celina E. Juliano

*Science* (2019-07-25) <https://doi.org/ggcd2p>

DOI: [10.1126/science.aav9314](https://doi.org/10.1126/science.aav9314) · PMID: [31346039](https://pubmed.ncbi.nlm.nih.gov/31346039/)

### 30. **Cnidarian Cell Type Diversity and Regulation Revealed by Whole-Organism Single-Cell RNA-Seq**

Arnau Sebé-Pedrós, Baptiste Saudemont, Elad Chomsky, Flora Plessier, Marie-Pierre Mailhé, Justine Renno, Yann Loe-Mie, Aviezer Lifshitz, Zohar Mukamel, Sandrine Schmutz, ... Heather Marlow  
*Cell* (2018-05) <https://doi.org/gdkxf5>  
DOI: [10.1016/j.cell.2018.05.019](https://doi.org/10.1016/j.cell.2018.05.019) · PMID: [29856957](https://pubmed.ncbi.nlm.nih.gov/29856957/)

### 31. **Cell type transcriptome atlas for the planarian *Schmidtea mediterranea***

Christopher T. Fincher, Omri Wurtzel, Thom de Hoog, Kellie M. Kravarik, Peter W. Reddien  
*Science* (2018-04-19) <https://doi.org/ggcd2n>  
DOI: [10.1126/science.aag1736](https://doi.org/10.1126/science.aag1736) · PMID: [29674431](https://pubmed.ncbi.nlm.nih.gov/29674431/) · PMCID: [PMC6563842](https://pubmed.ncbi.nlm.nih.gov/PMC6563842/)

### 32. **The *Drosophila* embryo at single-cell transcriptome resolution**

Nikos Karaïskos, Philipp Wahle, Jonathan Alles, Anastasiya Boltengagen, Salah Ayoub, Claudia Kipar, Christine Kocks, Nikolaus Rajewsky, Robert P. Zinzen  
*Science* (2017-08-31) <https://doi.org/gbvp2z>  
DOI: [10.1126/science.aan3235](https://doi.org/10.1126/science.aan3235) · PMID: [28860209](https://pubmed.ncbi.nlm.nih.gov/28860209/)

### 33. **Single-cell reconstruction of developmental trajectories during zebrafish embryogenesis**

Jeffrey A. Farrell, Yiqun Wang, Samantha J. Riesenfeld, Karthik Shekhar, Aviv Regev, Alexander F. Schier  
*Science* (2018-04-26) <https://doi.org/gdgtf>  
DOI: [10.1126/science.aar3131](https://doi.org/10.1126/science.aar3131) · PMID: [29700225](https://pubmed.ncbi.nlm.nih.gov/29700225/) · PMCID: [PMC6247916](https://pubmed.ncbi.nlm.nih.gov/PMC6247916/)

### 34. **The dynamics of gene expression in vertebrate embryogenesis at single-cell resolution**

James A. Briggs, Caleb Weinreb, Daniel E. Wagner, Sean Megason, Leonid Peshkin, Marc W. Kirschner, Allon M. Klein  
*Science* (2018-04-26) <https://doi.org/gdgg4d>  
DOI: [10.1126/science.aar5780](https://doi.org/10.1126/science.aar5780) · PMID: [29700227](https://pubmed.ncbi.nlm.nih.gov/29700227/) · PMCID: [PMC6038144](https://pubmed.ncbi.nlm.nih.gov/PMC6038144/)

### 35. **Single-cell mapping of gene expression landscapes and lineage in the zebrafish embryo**

Daniel E. Wagner, Caleb Weinreb, Zach M. Collins, James A. Briggs, Sean G. Megason, Allon M. Klein  
*Science* (2018-04-26) <https://doi.org/gdgg3>  
DOI: [10.1126/science.aar4362](https://doi.org/10.1126/science.aar4362) · PMID: [29700229](https://pubmed.ncbi.nlm.nih.gov/29700229/) · PMCID: [PMC6083445](https://pubmed.ncbi.nlm.nih.gov/PMC6083445/)

### 36. **The single-cell transcriptional landscape of mammalian organogenesis**

Junyue Cao, Malte Spielmann, Xiaojie Qiu, Xingfan Huang, Daniel M. Ibrahim, Andrew J. Hill, Fan Zhang, Stefan Mundlos, Lena Christiansen, Frank J. Steemers, ... Jay Shendure  
*Nature* (2019-02) <https://doi.org/gfvqww>  
DOI: [10.1038/s41586-019-0969-x](https://doi.org/10.1038/s41586-019-0969-x) · PMID: [30787437](https://pubmed.ncbi.nlm.nih.gov/30787437/) · PMCID: [PMC6434952](https://pubmed.ncbi.nlm.nih.gov/PMC6434952/)
